

# About Strivio

*The company behind the platform · July 2026*

---

Strivio is a Decision Intelligence platform that connects an organisation's strategic intent with what is actually in execution — and makes visible where the two do and do not line up. Strivio does not decide for you; it substantiates, simulates and learns from your corrections. The human stays in the seat.

## The company

Strivio is a product and trade name of **Dakota Digital B.V.** (Dutch CoC 88261034), a Netherlands-based software company focused on decision intelligence for strategy and portfolio. Contact: [info@strivio.systems](mailto:info@strivio.systems).

*Dakota Digital B.V. · Hildebrandlaan 23, 3768 GV Soest*

## What drives us — three design principles

- **Augment, not replace.** Strivio advises; the human decides. It is a decision cockpit and second opinion, not an autopilot.
- **Underclaim, over-deliver.** Cautious, defensible language — 'low coverage' rather than an assertive 'critical'. Rather too modest than too assertive.
- **Reliability is paramount.** One source of truth: screen and export show the same numbers, and every decision is traceable.

## Where it works

Strivio is built for complex organisations where strategy lives in documents and execution in a portfolio tool — and where no one sees, end to end, whether one covers the other. Healthcare is a natural home base: strategic centres, sectors and a large digital portfolio, with high demands on governance and data residency.

## How we engage

- **Scoped proof of value.** Every engagement starts with a scoped rollout on one Program Increment (about three months): from strategy input and portfolio connection to the first coverage and simulation insights — deliberately starting small to demonstrate value and governance early.
- **Safe from day one.** Fully EEA-hosted, strict tenant isolation, read-only source connection and a data processing agreement in accordance with the GDPR.
- **Evaluate, then scale.** Each phase is evaluated before the next begins; scaling happens in a controlled way, based on demonstrated results.

## Trust & governance

Trust is not an afterthought but a design requirement. The full safeguards are in the separate *Trust & Security* overview; the architecture and matching engine in the Technical Memo (under NDA). References and a demo are available on request.
